                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC phenotype in the organism or part; (5) a method of modulating the quality of of a selected phenotype that is displayed by an organism of interest or CC part and that results from the expression of a parent polymucleotide that CC encodes the polypeptide; (6) a method of enhancing the quality of a CC selected phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polymucleotide that CC encodes the polypeptide; and (7) a method of reducing the quality of a CC selected phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polymucleotide that CC encodes the polypeptide. The method is useful for constructing a CC synthetic polymucleotide from which a polypeptide is producible to confer CC quality than that conferred by a parent polymucleotide that encodes the polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes a synthetic leader sequence, which is used in an example from the present CC invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

       The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of the parent phenotypic preference than the first codon in a comparison of
                                                                                                                                                                                                                         Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.
                                                                                                                                                                                                                                                                                                      WPI; 2004-411519/38.

The present invention describes a method for constructing a synthetic consumulation of selected phenotype to an organism of interest or part in a different can expensive the parent polymucleotide. The method comprises: (a) selecting a first codon of the parent polymucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a companism are selected from organisms or parts, where the test corganism are selected from organisms or parts, where the test corganism are selected from organisms or parts, where the test corganism are selected from organisms or the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polymucleotide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polymucleotide constructed from the method above; (4) an cryanism or interest or part containing a synthetic construct that comprises a regulatory polymucleotide operably linked to a tandem repeat of a first codon fused in frame with a reporter produce, of a selected phenotype that is displayed by an organism of interest or part containing a synthetic polymucleotide that comprises a results from the expression of a parent polymucleotide that concate the polypeptide; (6) a method of endality of a selected phenotype that is displayed by an organism of interest or part concate the polypeptide; (6) a method of endacing the quality of a selected phenotype that is displayed by an organism of interest or part concate the polypeptide; (6) a method of endacing the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polymucleotide that concate the polypeptide; (6) a method of endacing the quality of a selected phenotype that is displayed by an organism of interest or part and concate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           08-NOV-2002; 2002US-0425163P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method for constructing a synthetic polynuclectide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynuclectide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of same polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12-AUG-2004

                                                                                                                                                                                                                                                                                                                                                                                   Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a kit for diagnosing and treating T-cell CC associated diseases which comprises a panel of nucleic acid primers CC specifically priming and allowing amplification of each Vbeta gene, CC VbetaRNA or cDNA. The kit is useful for diagnosing organ transplant CC rejection and diagnosing and treating T-cell associated diseases CC including autoimmune diseases, degenerative nervous system diseases. CC graft versus host diseases, hypersensitivity diseases, infectious diseases, CC graft versus host diseases, hypersensitivity diseases, infectious diseases, CC and neoplastic diseases. Autoimmune diseases include Addison's diseases, CC and reoplastic diseases. Autoimmune diseases include Addison's diseases CC antrophic gastritis. Degenerative nervous system diseases include multiple CC sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type CC Intypersensitivities such as context with allergens that lead to CC caused by viruses such as context with allergens that lead to CC goodpasture's syndrome and Type IV hypersensitivities such as those caused by the yeast genus Candida, parasitic infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes, filaria and bacterial infections such as those caused by chistosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Loc

The present invention describes a method for determining an individual's crisk for type 1 diabetes. The method comprises detecting the presence of CC a type 1 diabetes-associated polymorphism in the interleukin 4 (IIA) or CC IIA3 loci in a nucleic acid sample of the individual, where the presence of the polymorphism indicates the individual's risk for type 1 diabetes. CC The human IIA4 and IIIA3 genes are located on chromosome 5. Also described is a kit for determining an individual's risk for type 1 diabetes. CC comprising one or more sequence-specific oligonucleotide each CC conditions to a type 1 diabetes-associated IIA4 or IIA3 polymorphism, and CC individually comprising a sequence that hybridises under stringent CC conditions to use the kit to determine the individual's risk for type 1 diabetes-associated IIA4 or IIA3 polymorphism, and CC diabetes. Detection of one or more IIA4 or IIA3 polymorphisms in a nucleic CC acid sample of an individual, is useful for the determination of the present invention are also useful for the determination of the present invention are also useful for the determination of the conditions of CC undividual's risk for type 1 diabetes. The methods and compositions of CC untoimmune disease, such as multiple sclerosis, myasthenia gravis, CC uncerative colitis, pernicious anaemia, rheumatoid archiritis, systemic CC uncerative colitis, pernicious anaemia, rheumatoid archiritis, systemic CC untoimmune such in the exemplification of the present sequence represents a primer for human IIA receptor (IIAR) promoter polymorphisms, which is used in the exemplification of the present invention. The human IIA control in the control invention in the exemplification of the present invention. The human IIA control in the control invention in the camposition in the control invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pernicious anaemia; rheumatoid arthritis; systemic lupus erythematosus; inflammatory bowel disease; human; interleukin 4 receptor; IL4R; primer; ss; single nucleotide polymorphism; SNP; chromosome 16.

                                                                                                                                                                                                                                                                                                    media (EM) including a biodegradable polymer, and an isolated nucleic contact homologue sequence (II) encapsulated with EM, where the contact time. (I) have cytostatic and antimicrobial activities, and can be used in gene therapy. (I) can be used for sustained delivery and release of a nucleic acid homologue within a subject, by encapsulating a nucleic acid condition of a subject by sustained delivery of nucleic acid homologue within a subject by sustained delivery of nucleic acid homologue within a subject by sustained delivery of nucleic acid homologue, by encapsulating an isolated nucleic acid homologue sequence designed to alleviate symptoms of the medical condition within EM, so that nanoparticles are formed, and delivering the condition within EM, so that nanoparticles are formed, and delivering the comparticles into the subject, where the isolated nucleic acid homologue sequence is released over an extended period of time. A pharmaceutical composition comprising (I) can be used for treating a medical condition including cell proliferation disorder, an infectious disease, a genetic defect and aberrant gene regulation. The nanoparticles are capable of introducing the nucleic acid into the cell very efficiently. The present sequence represents a partial phosphorothioate antisense oligonucleotide for platelet derived growth factor receptor beta (PDGFR-beta), which is cused in an example from the present invention

                                                                                                                                                                                    The invention relates to a method for detecting Staphylococcus DNA in a sample by nucleic acid amplification using various primers (ABL58823-ABL58848) or their variants. The method is used to detect staphylococci that produce enterotoxins and/or are resistant to antibiotics (methicillin), e.g. in blood or tissue samples, foods, water and bacterial cultures. The method allows simultaneous determination of many genes since the specified primers are functional under the same conditions and it eliminates the need for a lengthy culture stage
                                                                                                                                                                                                                                                                                                                              Detecting Staphylococcus by nucleic acid amplification, useful for testing e.g. clinical samples, can identify simultaneously enterotoxin and methicillin-resistance genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as transfection vehicles. The present sequence represents a nucleic acid product of the invention, which is produced by a solid phase chemical reaction, and is modified at the 5' end by an alpha-oxoaldehyde
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18 BP; 5 A; 5 C; 3 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for determining racing potential of a horse. The method comprises measuring: whether grandpaternal DNA is over-represented in the genome of the horse; or in the case where one of the grandmothers was selected for breeding on the basis of racing performance, whether grandmaternal DNA from the selected grandmother is over-represented in the genome of the horse which indicates that the horse has good racing potential. The method of the invention is useful for determining the racing potential of a horse or for obtaining a progeny horse with good racing potential. This polynucleotide sequence represents a PCR primer used in the detection method of over-representation of DNA from male grandparents of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Determining the racing potential of a horse grandpaternal or grandmaternal DNA from the over-represented in the genome of the horse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Racing potential; horse; grandpaternal DNA; over-represented; breeding; grandmother; performance; progeny horse; PCR; primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    reaction system. The reaction system then undergoes the processes of high temp., low-temp., medium-low temp., medium-temp, and repeated heat circulation treatment in the heat-circulating instrument to obtain million copies of specific target DNA fragments. The invention adopts a multiple repeated heat circulation process, so that it can produce lots of target DNA fragments. The present sequence was used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            by that firstly, a pair of specific primers is synthesized according to the target DNA sequence to be amplified, then a repetitive sequence complementary oligo-repetitive sequence of 3' target DNA chain whose tail end is modified and elongation vitality is lost, then the oligo-repetitive sequence, chain primer, heat-resisting DNA polymerase, dNTP substrate, template DNA, magnesium ion, polymerase chain reaction (PCR) buffer solution and ultra-pure water are mixed uniformly and made into a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Asynchronous of target DNA

DNA

The specification describes a nucleic acid product attached to a suthrough a linker. The nucleic acid products of the invention are particularly useful as DNA chips for combinatorial chemistry, i.e. high throughput screening to identify new genes or pharmaceuticals

stably and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes a nucleic acid product attached to a support through a linker. The nucleic acid products of the invention are particularly useful as DNA chips for combinatorial chemistry, i.e. for high throughput screening to identify new genes or pharmaceuticals and for scudying toxicity, also for diagnosis. Alternatively, they are useful as transfection vehicles. The present sequence represents a nucleic acid product of the invention, which is produced by a solid phase chemical reaction, and is modified at the 5' end by an alpha-oxoaldehyde
                                                                                                                                                        Melnyk O, O: Wolowczuk I,
                                                                                      New product comprising nucleic chip, e.g. for diagnosis and as stably and covalently attached.
                                                                                                                                                                                                                                                                                                                                                    Key

Overexpression of native TRADD activates NF-kappa-B in the absence of TNF and dominant negative mutants of TRADD block TNF-induced NF-kappa-B activation. A second effect of TNF in many cell types is the induction of apoptosis (programmed cell death). TRADD overexpression has been shown to mimic TNF induction of apoptosis as well. Data indicates that TRADD and other downstream effector proteins are the rate limiting step of TNF action and would therefore serve as the most efficient targets for inhibition of TNF-induced events. Antisense oligonucleotides capable of inhibition TRADD function may therefore be useful in a number of therapeutic, diagnostic and research applications. Inhibiting expression of TRADD by contacting human cells or tissues with the antisense corrected and the service with the antisense conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the antisense compound may be used to treat a disease or condition associated with TRADD expression, for example, septic shock, inflammation, or cancer. TRADD antisense oligonucleotides of varying inhibitory capabilities are listed in GENESEQ records AA293438-Z93517. The antisense oligonucleotides exhibit enhanced inhibitory capabilities when they have 2'-MOE wings and a deoxy gap
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compounds that limit the expression of human TRADD protein, useful in the treatment and diagnosis of cancer, inflammation and septic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monia BP,

CC Arabidopsis sp. and AP2 domain containing genes include RAP2 (related to CC AP2) ANT and EREBPS. The AP2 gene is a floral homeotic gene. Each of CC these proteins contain AP2 like domains. Sequences AAB58813-B25888 CC represent protein fragments and peptides from ADC proteins such as CC RAP2.7. Sequences AAB5882-A97035 represent PCR primers used to isolate traits in canola and soybean plants and for creating transgenic plants. CC The nucleic acids can be used to confer desired traits on essentially any CC plant by increasing or decreasing gene expression. These may be used to increase seed size, protein, amino acid or oil content in crop plants in CC which seeds are used directly for animal or human consumption or for cindustrial purposes, such as soybean, canola and other grains. These may be also be used to decrease seed size or producing seedless varieties in CC be also be used to decrease seed size or producing seedless varieties in CC such as cherries, melons or tomatoes. Primers, which specifically amplify CC AP2 domains of the genes, are particularly useful for identification of CC particular ADC polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         soybean or canola plant comprising providing a plant having a recombinant expression cassette containing an ADC (APZ domain containing) nucleic acid linked to a plant promoter. ADC gene sequences are represented by AAA96979-A96981. The APZ gene (APETALA) was originally isolated from Arabidopsis sp. and APZ domain containing an ance in the interval area.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modulating seed traits useful for creating transgenic plants with altered seed size or protein content, by providing a plant with a recombinant expression cassette containing an ADC (AP2 domain containing) nucleic

AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6579 to AAZ7140 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3096, 3157, 3227, 3297 and 3367, are not actually given a sequence in the Sequence Listing from the present inventor.

                                                                                                                                                                                                          Nucleotide sequence AAC66182 encodes human trypsin hL AAB35701, a serine protease. The invention relates to the human hL gene and protein sequences, to a recombinant vector containing the nucleotide sequence, and a host cell containing the vector. Human trypsin hL can be used for screening for serine protease inhibitors, in the preparation of a lung disease model animal, and for the development of an index marker of lung diseases caused by an anti-trypsin hL antibody. The present sequence represents a PCR primer used in the identification of trypsin hL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             drug-drug interactions and adverse side effects. The polymorphisms can used as single nucleotide polymorphisms (SNNe) for detecting genetic linkage related to phenotypic variation in activity or expression of UGT2B protein. The polymorphism containing nucleic acid molecules may also be used for generating genetically modified non-human animals and for obtaining site specific gene modification in cell lines
                                                                                                                                                                                                                                                                                                                                                                      Novel gene encoding a serine protease and serine protease inhibitors and to prepare

                                                                                                                                                                                                                                                                                                                                                                                                             AAZ65554 to AAZ65578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ65579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the iderential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

glucuronosyltransferases (UGTs) are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates. The UGT2B gene subfamily encode steroid metabolizing isoforms in the liver. Alteration of the expression or function of UGTs may effect drug metabolism. The invention relates to more considered to the constant of the expression or function of UGTs may effect the metabolism. The invention relates to more constant of the constant of the
                                                                                                                                                                                                                                                        Novel human UDP-glucuronosyltransferase sequence, polymorphisms for genotyping individuals to predict rate of metabolism of substrates for identifying potential drug interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    especially humans, suspected of having or being prone to a disease condition associated with FADD expression. AAZ44746-Z44831 represer primers and probes used in the method of the invention

Probes which detect the UGT2B locus polymorphisms can be used to detect altered UGT2B metabolism of a substrate in an individual. The nucleic acid molecules comprising a human UGT2B sequence polymorphism can be used in screening assays for genotyping individuals, also to predict their rate of metabolism of UGT2B substrate, potential drug-drug interactions and adverse side effects. The polymorphisms can be used as single nucleotide polymorphisms (SNPs) for detecting genetic linkage related to phenotypic variation in activity or expression of UGT2B protein. The polymorphism containing nucleic acid molecules may also be used for generating genetically modified non-human animals and for obtaining site specific gene modification in cell lines
                                                                                                                                                                                             Novel human UDP-glucuronosyltransferase sequence, polymorphisms for genotyping individuals to predict rate of metabolism of substrates for identifying potential drug interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          drug

This sequence represents a PCR primer used to amplify a fragment of the human UDP-glucuronosyltransferase 2B15 (UGT9B15) gene. UDP-glucuronosyltransferases (UGT9) are a family of enzymes that catalyse the glucuronic acid conjugation of a wide range of endogenous and exogenous substrates. The UGT2B gene subfamily encode steroid metabolizing isoforms in the liver. Alteration of the expression or function of UGTs may effect drug metabolism. The invention relates to non-chromosomal nucleic acid molecules, which comprise human UGT2B sequence polymorphisms (see AAZ95051-Z95110). Probes which detect the UGT2B locus polymorphisms can be used to detect altered UGT2B metabolism of a substrate in an individual. The nucleic acid molecules comprising a human UGT2B sequence polymorphism can be used in screening assays for genotyping individuals,

                                                                                                                                                                                                                                                                                                                                                               The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV94575 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis, allergy and other inflammatory conditions. The ribozymes are also used to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 4; Page 49; 61pp; English.

seed protein using ADC (AP2 domain controlling seed size and total CC regulatory gene, over expression and antisense gene constructs. The CC method of modulating seed mass in a plant comprises: providing a first CD plant comprising a recombinant expression cassette containing an ADC CC crossing the first plant with a second plant, thereby producing a CC plurality of seeds; and selecting seeds with altered mass. The methods of CC expression. Enhanced ADC expression leads to smaller seeds or seedless CC fruit. The methods can be used to enhance or increase endogenous gene CC expression. Enhanced ADC expression leads to smaller seeds or seedless CC fruit. The methods can be used to produce a broad range of transgenic CC plants. Increasing seed size, amino acid content, and oil content is CC crice, wheat, corn, rye, etc.. Decreasing seeds size is useful in plants CC grown for their fruit and where large seeds are undesirable, e.g. cucumbers, tomatoes, cherries, melons. Sequences AAZO7667-690 represent CC amplifying the AP2 domains of the genes

The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 desaturase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canda plant). (I) can be used to modulate caffeine synthesis in a coffee plant, nicotine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                                                                                                         Zwick MG,

                                                                                                                 CC AP2 domain of the Arabidopsis RAP2.2 (related to AP2) gene. The PCR (product could then be used to identify AP2 domain containing (ADC) concleic acids, e.g. from a CDNA library, by using hybridisation CC techniques. The sequences of other primers used are given in AAV21064-V21115. The invention provides a method for modulating seed mass in CC plants. The method involves producing transgenic plants comprising a CC recombinant expression cassette containing an ADC nucleic acid linked to a plant promoter. In the example given, the Arabidopsis AP2 gene coding CC region was fused with the cauliflower mosaic virus (CMV) 35 constitutive product in the sense or antisense orientations. The genetic constitutive construct produced seed with increased mass and total protein content. Therefore this method is claimed to be useful in producing plants with improved traits, e.g. producing seeds with increased protein content, carbohydrate content or oil content, or producing seedless

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to loblolly pine polynucleotides with one or more Simple Sequence Repeats (SSRs) (see AAA74205-A74322). The present sequence is one such SSR repeat. SSRs are also known as microsatellite DNA repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant

```

The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases

degenerative nervous

This PCR primer was used to detect subtle mutations in the DP1 was used with AAQ33159. To obtain DNA sequence adjacent to the the gene, sequencing substrate was obtained by inverse PCR ampl of DNAs from two YACs 310DB and 183H12 that span the deletions. at low concentration cyclized the restriction enzyme digested Y

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides a method for identifying a set of extendible primers which can be used in the identification, typing and classification of genes. This can then be used to predict protein sequence and structure, in organ donation to match the organ with the receiver, and to identify bacteria in a sample. The method can be used type the human leukocyte antigen genes (HLA) and 16s rRNA genes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA sequence and gene typing; order human leukocyte

The present sequence is one such SSR repeat. SSRs are also known as microsatellite DNA repeats. The SSRs are useful as genetic markers for genetic mapping, population genetics studies and inheritance studies in various plant
                                                                                                                                                                                                                                                  Polynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding program.

INT PAPER CO.

cs,

Nelson CD;

AGRIC

2000-482836/42.

Polynucleotide having simple sequence repeat useful as markers in plants for genetic characterization e.g. genetic mapping study, an inheritance study of a commercially important trait in a plant breeding program.

Example; Page 49; 57pp; English

reducing the symptoms of a bacterial infection by biofilm-producing bacteria in a mammalian patient involves administering an antibacte

in a mammalian patient involves administering an antibacterial decreasing biofilm formation through modulation of csrC.

                                                                                                               similarity to luciferase of Photinus pyralis, Luciola mingrelica, L.cruciata, L.lateralis, Hotaria parcula, Pyrophorus plagiophthalamus, Lampyris moctiluca, Pyrocelia nayako or Photinus pennsylannanica, where in the luciferase, an amino acid is different from a corresponding residue in wild-type and has increased thermostability. Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the cell, producing the thermostable luciferase and a kit comprising the thermostable luciferase. The thermostable luciferase is useful in any bioluminescent assay which utilises luciferase/luciferin reaction as signaling mode. The present sequence is probably a mutagenic PCR primer used to construct a DNA encoding a mutant luciferase from Photinus pyralis, however it is displayed in figure 8, a figure not referred to anywhere in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADQ88658 standard; DNA; 23

                                                                                                                                                                       in the luciferase of Photinus pyralis, Luciola mingrelica, C. L. cruciata, L. lateralis, Hotaria paroula, Pyrophorus plagiophthalamus, C. Lampyris noctiluca, Pyrocoelia nayako or Photinus pennsylanvanica, where in the luciferase, an amino acid is different from a corresponding cresidue in wild-type and has increased thermostability. Also included are a nucleic acid which encodes the thermostable luciferase, a vector comprising the nucleic acid, a cell transformed with the vector, a plant comprising the thermostable luciferase and a kit comprising the thermostable luciferase is comprising the thermostable luciferase is comprising the thermostable luciferase is comprising the construct a sasy which utilizes luciferase/luciferin creaction as signaling mode. The present sequence is probably a mutagenic PCR primer used to construct a DNA encoding a mutant luciferase from comphotinus pyralis, however it is displayed in figure 8, a figure not referred to anywhere in the specification.

                     (GPCRS) and nucleic acids encoding them. The invention also relates to CC sequences at least 90% identical to the GPCR proteins and nucleic acids of the invention; methods of treating, preventing or diagnosing diseases associated with GPCRs of the invention; methods of screening for compounds useful in the treatment of GPCR-related diseases; a transgenic mouse comprising a GPCR gene of the invention; a mouse comprising a GPCR gene or in an endogenous GPCR gene; cells derived from the transgenic mice; kits comprising several mice, each of which has a mutation in a different GPCR gene of the invention; and kits comprising to the invention; and kits comprising comprises which hybridise to GPCR polynucleotides of the invention. The CC comprising a GPCR nucleic acids of the invention. The CC comprising a GPCR nucleic acids and proteins may be used in the diagnosis, treatment or prevention of a wide variety of disease including neurological disorders (e.g., Alzheimer's disease, dispersed on, diabetic neuropathy, Parkinson's disease, or schizophrenia);
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           KW transgenic mouse; neurological disorder; adrenal gland disorder;

CsrC polynucleotide, used in reducing infection by biofilm producing bacteri producing bacteria the symptoms of a bacterial is in a mammalian patient.

Example; SEQ ID NO 11; 57pp; English.

The present sequence is that of PCR primer DISerB for the csrC gene AD076906 of Escherichia coli strain K-12. DISerB was used with primer DICheckl AD076916 in an example from the invention for the construction of a csrC mull mutant. CsrC interacts with the RNA-binding protein CsrA, and antagonises the regulatory effects of CsrA. The invention relates to the csrC gene and RNA, and methods of using these to modulate biofilm cformation. A claimed method of altering the metabolism or structural or functional properties of a bacterial cell comprises altering the genetic expression of csrC may be a change in glycogen biosynthesis or gluconeogenesis. A claimed method of reducing biofilm-formation involves decreases csrC transcription in a biofilm-forming cell. A claimed method of inhibiting motility of biofilm-producing bacteria comprises increasing csrC expression. A claimed method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to human nucleic acid sequences (I; AD015739-AD015912) obtained from 4 synthesis-period (stage 4S) of neuroblastoma cell. (I) is useful for prognosing and determining progress stage of 4 synthesis-period of neuroblastoma. The present sequence is a primer, used to illustrate the invention.
                                                    produce human IFN alpha 2b protein; and purifying recombinant human IFN alpha 2b protein from the culture medium. The method is useful in preparing and purifying recombinant human IFN alpha 2b protein for the manufacture of a medicament for treating viral diseases, e.g., hepatitis B, or cancer, e.g., bladder carcinoma. Sequences ADO44363-ADO44373 represent specific examples of primer pairs used in a RT-PCR reaction to isolate the human IFN alpha 2b gene of the invention.
                                                                                                                                                                                                                                                                  The invention relates to preparing and purifying a recombinant human interferon (IFN) alpha 2b. The method involves cultivating recombinant Pichia pastoris containing a human IFN alpha 2b gene; culturing the recombinant Pichia pastoris in complex/defined salt culture medium to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Preparing and purifying a recombinant human IFN alpha 2b by culturing the recombinant Pichia pastoris in complex/defined salt culture medium and purifying recombinant human IFN alpha 2b protein from the culture medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Lohray BB,

The present sequence represents one of 276 HLA locus-specific capture oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a method of identifying a human leukocyte antigen (HLA) genotype of a subject comprising: obtaining a sample comprising a template nucleic acid from the subject; amplifying the template nucleic acid with HLA allele-specific forward primers and HLA allele-specific

The method uses amplification primers which have 5' tags to incorporate into amplicons, variant nucleotides from target nucleic acids at known ratios, with or without sequences surrounding the variant nucleotides of interest. The method is useful for genotyping or for performing primer extension reactions, for screening animals for susceptibility to a disease or disorder (e.g. scrapie), or for breeding scrapie-resistant sheep. The sequences of ADJ46685 and ADJ46717 flank a S (c/g) single nucleotide polymorphism (SNP) and were used to illustrate the method of the invention using primers ADJ46686-ADJ46691 and probes ADJ46692-
                                                                                                                                                                               Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Performing a primer extension reaction, useful for e.g. genotyping, comprises employing amplification primers having 5' tags to incorporate into amplicons, variant nucleotides from target nucleic acids at known

The methods are useful for CC predicting and determining toxicological responses on a cellular, organ cor system level. The arrays comprising the human genes are useful for CC toxicological screening of drugs, pharmaceutical compounds and chemicals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                      of imatinib would be effective against disease by assaying the expression of genes selected from a set of 77 genes. The 77 genes include HNI, AKRIC3, QARS, KIAA1105, KIAA0668, BLCAP and ADFP. The novel method is useful for assessing if administration of imatinib would be effective against diseases such as chronic myeloid leukaemia. Twelve samples of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ADF88693 standard; DNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     primers and superscript II reverse transcriptase were used to reverse transcribe the RNA and then PCR used to amplify 200-1100bp fragments. These were separated by agarose gel electrophoresis and spotted onto glass slides. Five different slides, each with 4608 cDNAs were prepared. The primers used to identify the 77 genes were of sequences 1-154, the odd numbers being the forward primers and the even numbers the reverse
                                                                                                 association with reproductive abnormalities. The present invention provides a kit to evaluate environmental pollution, which uses methods that assess the toxicity of chemicals, for example endocrine disrupters, on the expression of such proteins involved in fish reproduction. This oligonacleotide sequence is a PCR primer given in an exemplification of
                                                                                                                                                                            This invention relates to novel proteins concerned with reproductive organ formation of fish. Specifically, it refers to proteins that are involved in the formation of fish external genitalia and how toxic chemical substances affect these proteins, and accordingly the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gambusia

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligonucleotide. Specifically, the siNAs include short interfering RNA (eiRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (ehRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the G72 gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. The human G72 siNAs have neuroleptic activity and can be used for treating schizophrenia. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and relationship.
                                                                                                                    Determining a toxicological response to an agent, useful for screening drugs, comprises comparing the expression profile of one or more human toxic response genes to a reference gene expression profile indicative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human G72 gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA
                                                                                                                                                                                                WPI; 2003-268322/26
                                                                                                                                                                                                                                                                                                                                                                16-AUG-2002; 2002WO-US026514

                                                                                                                                                                                                                                                                                                                                                      문
                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The invention relates to regulating a gammadelta T-cell mediated immune CC response in a mammal and involves administering to the mammal a soluble CC gammadelta T cell receptor (TCR). The method is useful for treating CC e.g. Crohn's disease, ischaemic colitis, irritable bowel disease, and CC colon cancer; a lung condition associated with inflammation such as CC airway hyperresposiveness, pneumonia, tuberculosis, and a primary or CC metastatic lung tumour; a skin condition associated with inflammation CC metastatic lung tumour; a skin condition associated with inflammation CC such as skin lesion caused by bacterial infection, viral infection or CC laceration, and a skin cancer; or a condition associated with CC inflammation of the reproductive tract such as infection caused by CC inflammation of the reproductive tract such as infection caused by CC bacterial or viral infection that involve the epithelial mucosal lining, CC to the day and a stream of the condition associated with such as infection, preventing tubal factor infertility, and a cancer Schedelta Schibber CC Ronar CC Sequences ACF35969-978 represent PCR primers used to amplify and alter CC the deltar and the CR primers used to amplify and alter
                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

The method is used for determining the HLA genotype of a subject. The present sequence represents a HLA class II allele
                                                                            New cell, comprising alanine 2,3-aminomutase activity, useful for producing beta-alanine from alpha-alanine, 1,3-propanediol, pantothenate, COA, HP or 1,3-propanediol.

                                                                                                                                                                                                                                    CC fully defined sequence of 197 bp (see ADA00283) or 317 bp (see ADA00284), cor its homologue or complement. Also described: (1) a mulciat acid primer of the homologue or complement. Also described: (2) a mulciat acid primer of (2) a polypeptide translated from (1); (3) a composition suitable for detection of variant forms of alpha-foetoprotein (AFP) mank comprising a conditions to a nucleic acid primer of (1); (4) a polypucleotide primer comprising of etecting a variant form of AFP mank comprising combining a sample conditions to a nucleic acid encoding a variant form of AFP mank comprising combining a sample conditions to a nucleic acid encoding a variant form of AFP mank comprising combining a sample conditions to a nucleic acid encoding a variant form of AFP mank, and reagents for capable of hybridishing to a variant form of AFP mank, and reagents for CR to form a mixture, subjecting the mixture to therm ocycling, and determining the absence or presence of cDNA corresponding to a variant form of AFP mank, (6) identifyling or detecting haemopoietic stem or progenitor cells comprising determining the presence or absence of a variant form of AFP mank, (6) identifyling or detecting haemopoietic stem or composition of AFP mank, (6) identifyling or detecting haemopoietic stem or composition of AFP mank, (6) identifyling or detecting haemopoietic stem or composition of AFP mank, (6) identifyling or detecting haemopoietic stem or composition of AFP mank, (7) or its fusion, (8) a probe capable of detecting the expression of caid encoding a variant form of AFP mank, and season to composition of AFP comprising a polynucleotide which encodes a variant form of AFP comprising a polynucleotide which encodes a variant form of AFP. (10) composition completic progenitors, (11) preparing a subpopulation of cells which expresses a variant form of AFP.

CC composition comprising at least one subpopulation of cells which complets, and celecting and (12) a composition are acid in central to composition and celecting and composit

The promoter is linked to at least one operator selected from xylo, teto, trpo, malo and lambda-clo, which are operator selected from xylo, teto, trpo, malo and lambda-clo, which are operator represses transcription from the fusion promoter. Also included are a vector comprising the isolated nucleic acid, a host cell comprising the nucleic acid. The fusion promoter is useful for identifying genes of involved in cellular proliferation, identifying a compound that reduces the activity or level of a gene product required for proliferation of a cell, inhibiting the activity or expression of a gene in an operon crequired for proliferation, manufacturing an antibiotic, identifying a compound that is required for proliferation of a prokaryotic cell, dentifying a compound that inhibits the proliferation of a prokaryotic cell and regulating gene expression in bacteria. The present sequence is a PCR primer used in the construction of a fusion promoter of the

Also included are:

CC (1) a vector comprising a promoter operably linked to the nucleic acid

CC encoding a polypeptide whose expression is inhibited by the antisense

CC nucleic acid; (2) a host cell containing the vector; (3) an isolated

CC polypeptide or its fragment whose expression is inhibited by the

CC antisense nucleic acid; (4) an antibody capable of specifically binding

CC polypeptide; (5) producing the polypeptide; (6) inhibiting cellular

CC proliferation or the activity of a gene in an operon required for

CC proliferation; (7) identifying a compound that influences the activity of

CC proliferation; (7) identifying a compound that influences the biological

CC proliferation or that has an activity against a biological pathway

CC required for proliferation, or that inhibits cellular proliferation; (8)

CC or a gene product or that compound that inhibits proliferation of an

CC compound's activity; (11) a culture comprising strains in which the gene

CC or a gene on which the test compound that inhibits proliferation of an

CC compound's activity; (11) a culture comprising strains in which the gene

CC product is overexpressed or underexpressed; (12) determining the extent

CC which each of the strains is present in a culture or collection of

CC strains; or (13) identifying the target of a compound that inhibits the

CC proliferation of an organism. The antisense nucleic acids are useful for

CC identifying proteins or screening for homologous nucleic acids required

CC for cellular proliferation to isolate candidate molecules for rational

product for proliferation of the organism, contacting the culture with a compound to inhibit proliferation of strains that do not overexpress the product and identifying the product overexpressed in a strain that proliferated more rapidly. The method is useful in identifying the target of a compound which reduces the activity or level of gene products required for cellular proliferation. The method may also be used for identifying the therapeutic compounds that act on the novel targets. This sequence represents a PCR primer used to amplify nucleic acid sequences which inhight the activity of captured to amplify nucleic acid sequences

                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes human adenylate cyclase type IV (I). (C) has hypotensive, osteopathic, antianginal, cardiant, vasotropic, antiatherosclerotic, vulnerary, cerebroprotective, antiulcer, antiatherosclerotic, vulnerary, cerebroprotective, antiulcer, antiatherosclerotic, antiallergic, antimigratine, nootropic, tranquilliser, activated in gene therapy. (I) can be used in the treatment of an adenylate cyclase type IV dysfunction related disease, in particular hypertension, creatensis, and pectoris, myocardial infarction, creatensis, atherosclerosis, angina pectoris, myocardial infarction, creatensis, atherosclerosis, a disease characterised by excessive smooth countries of an adenylate coll proliferation, aneurysms, wound healing, stroke, ischaemia, ulcer, asthma, allergy, benign prostatic hypertrophy, migraine, vomiting, psychotic, neurological collisorder, including anxiety, schizophrenia, manic depression, depression, delirium, dementia, severe mental retardation and degenerating the expression of adenylyl cyclases in human bronchial endothelial cells, which is used in a vermit of from the areas of the procession of adenylyl cyclases in human bronchial endothelial cells,
                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                    The invention relates to an expression cassette which comprises a control sequence having a PuRs (purine-rich sequence) fragment of an Emr1 promoter which fragment has enhancer activity and a promoter; and a heterologous protein coding sequence operably linked to the control sequence. The cassette or vector is useful in treating or in manufacturing a medicament for treating skin diseases in humans or animals by gene therapy. The skin disease includes psoriasis, allergic dermatitis, eczema, cutaneous leishmaniasis, melanoma or other skin cancer. The cassette or vector may also be used in modulating an immune response or in manufacturing a vaccine for genetic vaccination. The present sequence is Emr1 PuRs fragment. This fragment is used in the

                                                                                                                                                                                                                                                                                            The present invention relates to methods for detecting a cancerous colon cell involving detecting at least one differentially expressed gene such as those given in AAL4155-AAL4161. This is useful for diagnosing colon cancer, in rational drug and therapy design, and for identifying additional genes linked to the development or inhibition of development of colon cancer. Examples of colon cancer which can be detected include adenomatous polyp, colorectal carcinoma, high metastatic potential colon tumours and metastatic colon cancer. The present sequence is an antisense sequence directed at a colon cancer associated protein coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting a cancerous colon cell, useful for diagnosing colon cancer and for rational drug and therapy design, comprises detecting at least one differentially expressed gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          metastatic colon cancer; antisense; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                   The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese. The present sequence is an oligonucleotide used in an example from the invention. Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at the production of yogurt and the patent work of the published pct_sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (I) overcomes the problems associated with the current blue screen technology such as plasmid instability due to vector-driven transcription of the insert DNA. The system addresse this problem by eliminating promoter elements near cloning sites, and providing termination after selectable markers. Isolated nucleic acid comprises bacterial promoters modified to have altered activity in at least one gram-positive organism, e.g. Bacillus anthracis or Clostridium botulinum, useful for regulating gene express: expression

The invention relates to an isolated nucleic acid comprising a fusion CC promoter comprising at least one promoter that is modified to have CC altered activity in at least one promoter that is modified to have CC promoter activity in at least one promoter for comprising CC 15, CP25, P32, P59, P1P2 or PL linked to at least one operator consisting CC of xylo, tetO, trpO, malO or lambdaclO, where at least one operator is CC possitioned so binding of a repressor to an operator represses CC transcription from the fusion promoter. Also included are vectors and CC prokaryotic cell using the vector, a method of identifying genes CC involved in cellular proliferation or required for proliferation of a compound that reduces the activity or level of a gene product required for proliferation of a compound that reduces the activity or level of a compound identified by the methods, a method of inhibiting the vector, a cc compound identified by the methods, a method of inhibiting the activity or expression of a gene in an operon required for proliferation using the vector, manufacturing an antibiotic comprising using the vector or cell and identifying a nucleic acid with promoter activity in Enterococcus CC polypeptide expression, particularly for regulating gene expression in bacteria and for identifying proliferation-required genes or molecules with potential antiblotic activity. The modified promoters are also custful for replacing endogenous promoters to create cells with specific regulatable genes in the present sequence is a PCR primer used to isolate proliferation affected genes from S. aureus which has been transformed with a vector committian g fusion promoter sequence of the invention

The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus funigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAS23687-AAS23747 represent primers A #1-61 used as probes for identifying C. albicans GRACE strains
                                                                                                                                         Human cGMP-inhibited phosphodiesterase 17 and encoded polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-MAY-2001

This invention relates to human cGMP-inhibited phosphodiesterase 17

+ 1 vector components are non-contiguous within the circular recombinant vector. The system comprises X + 1 vector, where = 1, 2, 3, 4, 5 or 6. Also described is a composition comprising X + 1 vector components configured for combining in the presence of X + 1 insert sequences to form a circular recombinant vector, where the X + 1 vector components are non-contiguous within the circular recombinant vector. (I), a composition and kits from the present invention are useful for cloning and sequencing insert nucleic acid sequences. In particular, they are useful for multiplex cloning, multiplex sequencing and fixed orientation cloning.

comprising at least two separate source nucleic acid molecules for supplying X+1 vector components configured for combining in the presence of X+1 insert sequences to form a circular vector, when

The present invention describes a system

(I) for cloning nucleic

where the

Included in the invention are a vector containing the nucleotide sequence, a host cell transformed with the vector and an antibody directed against the phosphodiesterase 17 proteir. The protein, nucleotide sequence and antibody can be used in the treatment or diagnosis of malignant tumours, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammatory disorders. Use of the protein, DNA sequence or antibody may result in cytostatic; haemostatic; viruside; immunomodulatory; and antiinflammatory activity. The present sequence represents a PCR primer specific for cDNA encoding human cGMP-inhibited
                                                                                                                                                                                                                                                                                               Mead
                                                                                                                                                                             Example 10; Page 81; 133pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                          acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at least one toxin
                                                                                                                                                                                                   Corynebacterium sp., Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonads group, Streptococcus sp., Neisseria gonorrhoeae and Staphylococcus sp. Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                           gene. hexA nucleic acids are used for the specific and ubiquitous detection and for identification of Streptoccus pneumoniae. (I) can bused to design a therappeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens. Bordetella sp., contractor and actions a species or service actions and actions and actions and actions are contractors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Species specific; genus specific; family specific; probe; detection; identification; algal; archaeal; bacterial; fungal; parasitical; microorganism; diagnosis; translation elongation factor Tu; toxin; translation elongation factor G; RecA recombinase; resistance; catalytic subunit of proton-translocating ATPase; antimicrobial; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpb and/or recA genes from which probes and/or priners are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample.
                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               which can be used to identify and detect t bacterial, fungal and parasitical species
